

OPPORTUNITY KNOCKS

Now is the time for Guernsey to take the lead and become the most advanced example of waste disposal techniques in “The World”. To grasp the nettle and become the example to follow.

The alternative is dire, to trudge along as a pale failure in England’s wake making the same mistakes which “The Incinerator” exemplifies. Dangerous, expensive, wasteful, polluting, retrograde, ugly, negative and doomed. The Incinerator’s very existence reducing the notion of re-use of materials by their destruction. An insult to `The Creator`.

Kerbside recycling will be fun, different colour bags for everyone to feel they are taking part in a giant leap forward, something for Guernsey to be good at, collected for the sole purpose of re-using everything. Waste Not, Want Not. A positive purposeful aim to succeed, a game to win, to be best at.

The largest element of `rubbish` is paper, card, rags, etc which can be mixed with sewage and livestock slurry in Bio gas plants (Anaerobic Digestors). This produces sterilized soil to be put back onto farmland AND gas for energy generation. This kills two birds with one stone at a price still way below anything like “The Incinerator”. We get sewage thrown in (the system produces the sterilized soil which is odourless). Guernsey can hardly boast of being “The White Knight of Waste Disposal” without sewage treatment. Tyres can be fragmented and mixed with tarmacadam for new quiet roads. Builder’s rubble for clean land reclamation, (in Guernsey’s case further land from the sea as time goes by.) Guernsey’s new vision of a highly respected highly regulated `Finance Sector`, squeaky clean, can only be improved by this recycling initiative.

It’s a World Beater concept.
